### Abstract

Nickel oxide (NiO) nanoparticles have been synthesized via sol-gel method. In this method, ascorbic acid was used as a reducing reagent and ethylene glycol was used as a sol stabilizer and diffusion barrier. The structural property is studied by FTIR spectroscopy while particle size is determined from X-ray diffraction. The result obtained confirms the presence of nickel oxide nanomaterial with particle size 25nm. The photocatalytic activities of NiO powders were evaluated by measuring the degradation of Methyl Red (MR) in water under the UV region.

**Keywords:** NiO, sol-gel method, band gap, photodegradation.

### 1. Introduction

Nanomaterials exhibit significantly mechanical, electronic, magnetic, thermal, catalytic properties, and optical properties in comparison with their bulk counterparts and have extensively attracted interests in the field of environmental application such as air and water pollution, cosmetic technology, health care, catalysis, tissue engineering, medical diagnosis and therapeutics sensors and communication engineering etc.<sup>[1, 2]</sup>. NiO nanoparticles may have many applications such as in the manufacture of electrochromic, films, magnetic materials, p-type transparent conducting films, gas sensors, catalyst, alkaline batteries cathode, and solid oxide fuel cells anode<sup>[3-10]</sup>. Typically, preparation of nickel involves the solution phase chemistry

route, which in theory should provide multiple, simple ways to control the morphology, particle size and desirable crystalline phase. Ideally, the process should be amenable to scaling up.

Photocatalytic oxidation deals with photoactivated metal oxides as semiconductors involves in removal of contaminants from aqueous environment. The photocatalyst should be capable of degrading the pollutant and have properties like biological and chemical inertness, stability towards photo corrosion, low cost and non-toxic. The photocatalytic reaction involves transfer of electrons from valence bands to conduction bands on absorbing radiation of sufficient energy.

Methyl red is one of the anionic azo dye commonly used in textile and paper printing dyeing<sup>11</sup> and it causes irritation of the eye, skin and digestive tract if inhaled/swallowed<sup>12</sup>. These dyes bind to the textile fibers such as cellulose and cotton through covalent bonds<sup>13</sup>. Methyl red are azo based chromophores which combines with various types of reactive groups. The reactivity has been attributed to the presence of sulphonate groups and azo bonds.

Nickel nanoparticles have been synthesized by reduction of metal salts using reducing agents such as  $\text{NaBH}_4$ <sup>[14-15]</sup>, hydrazine<sup>[16-19]</sup> and polyols<sup>[20-24]</sup>. The uses and performance for a given property and application are, however, strongly influenced by the crystalline structure, the morphology, and the size of the particles. Therefore, it is very important to develop methods for the synthesis of nickel oxide nanoparticles in which the particle size and the crystal structure of the products can be controlled.

In this paper we reported a method for the synthesis of nickel oxide nanoparticles by sol-gel method and it is well dispersed, sphere-shaped, highly stable using alkaline ascorbic acid in glycol atmosphere.

### **2.1 Materials and methods**

All chemicals used were of analytical reagent grade purchased from Merck. Doubly distilled water was used throughout. Fourier- Transform infrared (FT-IR) were recorded at a range of  $4000\text{-}400\text{ cm}^{-1}$  using a Shimadzu FTIR Spectrometer. The crystal structure was studied by a Bruker D8 advance X-ray Diffractometer at UGC-DAE Consortium, Indore with Cu-K radiation ( $\lambda = 1.54\text{ \AA}$ ) to check the phase system and purity of the sample. The diffuse reflectance of the nanocomposites was performed at UGC-DAE Consortium, Indore using

## 2.2 Synthesis of Nickel Oxide nanoparticles

20 ml of ethylene glycol and 0.1M of nickel acetate solution was stirred for 15 minutes. To that solution alkaline ascorbic acid was added dropwise within a period of 30 min. the molar ratio of NaOH to ascorbic acid was set to be as 1:0.1 mole. After addition of alkaline ascorbic acid to metal salt solution, green colour ppt. of nickel hydroxide was formed. The ppt. was then washed with double distilled water and then with alcohol. The ppt. was then dried at oven at 250°C for 5 hours. The chemical reaction between nickel acetate and NaOH is as follows:

Nickel hydroxide decomposes by heating to nickel oxide as:

## Results

### 3.1 XRD

The XRD pattern of NiO nanoparticle is as shown in Fig. 3.1. The characteristic peaks of NiO nanoparticle occur at  $2\theta$  values of 17.15°, 29.91°, 33.89°, 37.71° and 44.72° corresponding to the Miller indices of (111), (200) (220) (311) and (400), respectively. All these diffraction peaks can be perfectly indexed to the face-centered cubic (FCC) crystalline structure of NiO<sup>25</sup> is in accordance with that of the standard spectrum (JCPDS, No. 40-1191). The crystallite size of the nickel oxide nanoparticles was calculated from the full-width at half-maximum (FWHM) of the (200) peaks in the XRD patterns using the Scherrer equation and calculated to be 28nm.

### 3.2 FTIR

The IR spectrum of the precursor nickel oxide nanoparticle is shown in Fig.3.2. The broad absorption band centered at 3639  $\text{cm}^{-1}$  is attributed due to the band  $\nu_{(\text{O-H})}$  stretching vibrations, and the band at 1604  $\text{cm}^{-1}$  is attributed due to bending mode  $\delta_{(\text{H-O-H})}$ . The band at 1327  $\text{cm}^{-1}$  is primarily due to the bending vibration of ionic  $\text{CO}_3^{2-}$ . The three bands appearing around 1155  $\text{cm}^{-1}$ , 952  $\text{cm}^{-1}$ , 750  $\text{cm}^{-1}$  confirm the presence of  $\nu_{(\text{C-O})}$  in the precursor. The strong band at 478  $\text{cm}^{-1}$  corresponds to the banding vibration of NiO<sup>26-27</sup>.

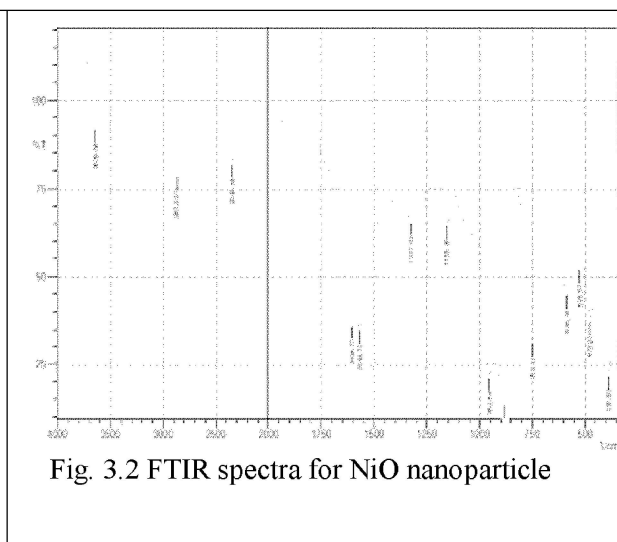

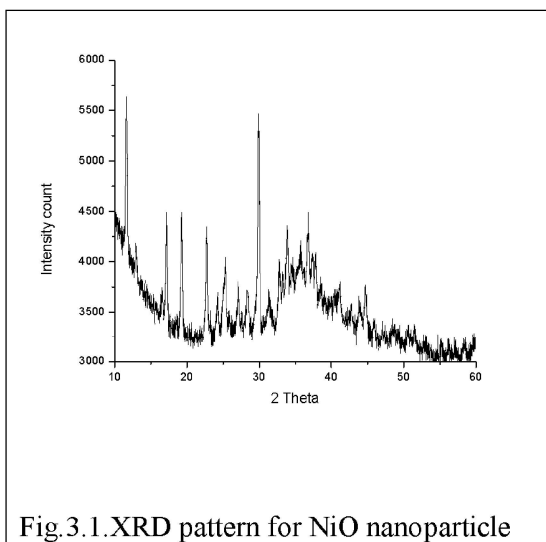

### 3.3 Diffused Reflectance spectra

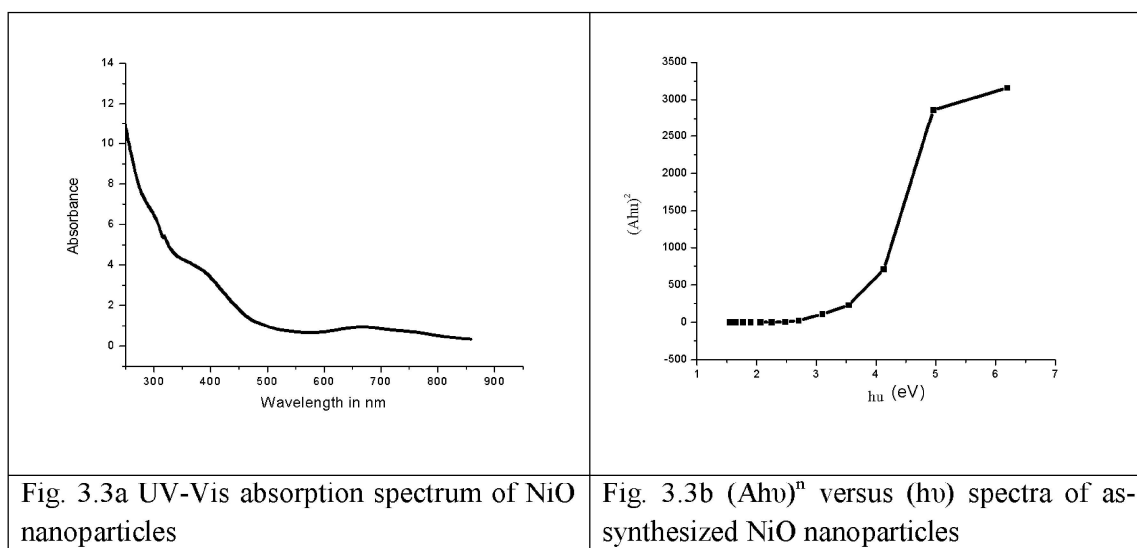

The optical properties of NiO nanoparticles have been evaluated from their UV-vis absorption spectral studies. Fig. 3.3a and b shows the absorption spectra and Diffused

Reflectance spectrum of nickel oxide nanoparticles sample. It is well known that the relationship between absorption coefficient ( $\alpha$ ) near the absorption edge and optical band gap ( $E_g$ ) obeys the equation (3.8) for a semiconductor where B is the parameter that relates to the effective masses associated with the valence and conduction bands,  $h\nu$  is the photon energy and n is either two for a direct transition or half for an indirect transition. The absorption edges are seen to be shifted slightly towards lower wavenumber (blue shift). This shift indicates an increase in the band gap, which can be attributed to a decrease in particle size. The value of the absorption edge of NiO nanoparticle was 320 nm, blue shift was observed due to the quantum confinement effects. According to the data of the absorption spectra, the optical band gaps ( $E_g$ ) of NiO nanoparticles can be estimated by using the following equation:

$$(Ah\nu)^n = B (h\nu - E_g) \quad (3.8)$$

Hence, the optical band gap for the absorption peak can be obtained by extrapolating the linear portion of the  $(Ah\nu)^n - h\nu$  curve to zero shown in Fig. 3.13b. The band gap is determined by extrapolating the linear portion of the plot to the energy axis. The corresponding band gap energy to be calculated 3.87 eV for sample, which was good agreement with the value of 3.6- 4.0 eV for the NiO nanoparticles<sup>28</sup>. This clearly indicate the presence of quantum size effects in the prepared NiO by Sol-gel method.

### 3.4 Photocatalytic degradation of methyl red

Water is polluted by the effluents discharged from various industries and some of the pollutants are acids, dyes, heavy metals and nanoparticles. The polluted water bodies lead to the lack of safe drinking water. Hence an efficient method is required to remove the pollutants from the wastewater. Membrane technology is an emerging technology used for water treatment. Among the various membrane fabrication techniques, electrospinning gained popularity because of its large surface area to volume ratio and high porosity. Many polymeric nanomaterial have been prepared by using electrospinning technique. Electrospun nanofibre membranes have been extensively studied for the removal of hazardous pollutants from the wastewater.

Dyes are chemical compounds that are used to impart the colour to various materials. Many industries like dyestuffs textile, additives, paper and plastics, foodstuffs, laser material, leather etc are generating wastewater that are highly toxic, carcinogenic, mutagenic<sup>28</sup>. Methyl Red (MR) degradation was performed using the NiO metal oxide semiconductor nanomaterial. The methyl red dye is one of the generally accepted organic pollutants for degradation studies and is used as an industrial standard.

In order to study to study the photocatalytic property of our synthesized products, we measured the optical property changes of dye in aqueous solutions in absence as well as in the presence of NiO nanoparticle under the exposure of light for 2hr. The experiment is carried out under different concentration of dye at pH = 7 and keeping the photocatalyst constant conditions. The maximum absorbance was found to be at 430 nm. According to the principles of metal oxide

photocatalysts, the energy gap are generated on the surface of oxide when are irradiated in photon light which can either exceeding or equaling the band gap energy, an electron may be promoted from the valence band to the conduction band ( $e^-_{cb}$ ) leaving behind an electronic vacancy or “hole” in the valence band ( $h^+_{vb}$ ). If charge separation is maintained, the electron and hole may migrate to the catalyst surface where they participate in redox reactions with the sorbed species.

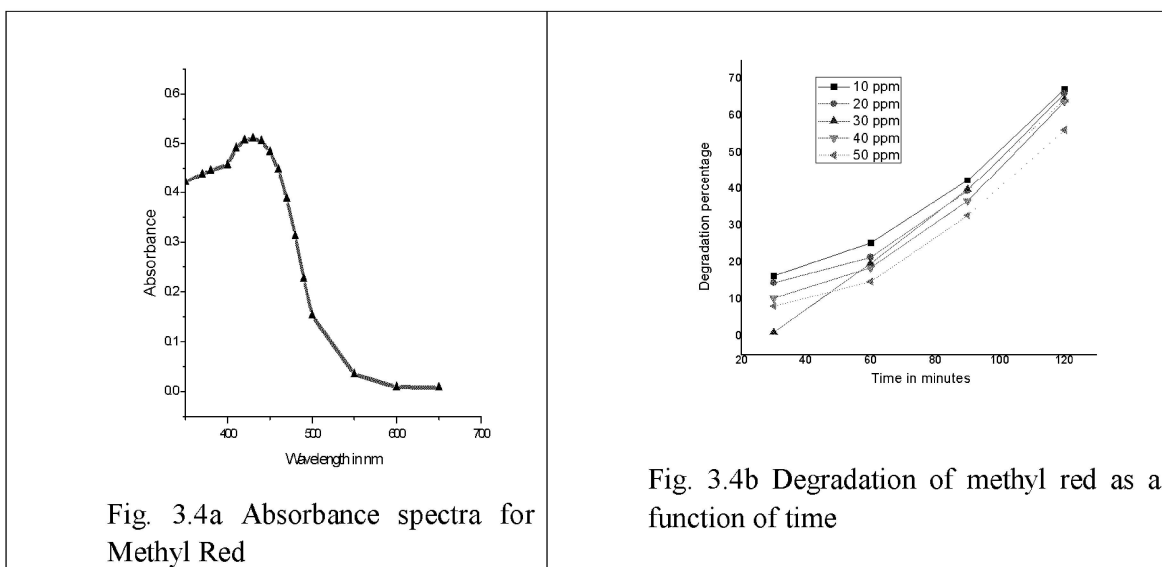

Fig 3.4b shows the degradation of methyl red dye using nickel oxide nanoparticles. Effect of nickel oxide on different concentration of methyl red dye as 10 ppm, 20 ppm, 30 ppm, 40 ppm and 50 ppm was studied. And the weight of catalyst was taken to be constant as 1gm/lit. It was found that with the increase in concentration of the organic pollutant, the degradation percentage was decreases. The photocatalytic activity of metal oxide depends upon the crystal structure, crystallinity, particle size and surface to volume ratio. All these parameters are responsible for the degradation of any organic pollutant. A plot shows the percent degradation versus irradiation time (min) for the suspension of MR in the presence of nickel oxide nanoparticle which reveals that around 67.21% for 10 ppm, 66.01% for 20 ppm, 64.65% for 30 ppm, 63.81% for 40 ppm and 56.81% for 50 ppm degradation takes place after 120 min of irradiation in the presence of catalytic iron oxide NPs. The obtained data for degradation and rate constant is presented in Table I.

**Table I: Degradation rate constant**

Sr. No.	Concentration	Degradation rate Constant (min <sup>-1</sup> )	Degradation Percentage
1.	10 ppm	0.0139	67.21%
2.	20 ppm	0.0137	66.01%
3.	30 ppm	0.0137	64.65%

### **Abstract:--**

Cancer is a disease where anomalous cells grow with no control and can march into other tissues. Cervical cancer is most widespread cancer in women globally. In view of challenges and limitations of the existing manual screening test on, it is essential to achieve the intelligent system with superior exactness for detecting cervical cancer abnormal cells at early stage. Image processing in medical field is most significant and tough as early detection and analysis of cervical cancer is difficult and time consuming task. For improving early detection and treatment stages in various cancers Image processing techniques are used. Dividing the image into numerous segments for the purpose of locating objects and boundaries in image is done by using Image segmentation method. Image thresholding is one of the techniques of image segmentation which binarize the image based on pixel intensities as it divides the image into two groups of pixels i.e black and white pixels. This paper focuses on implementation of two techniques that are simple thresholding and adaptive thresholding specifically on pap smear images of Cervical cancer. For implementing the proposed work results of Image thresholding python openCV library is used. To verify the comparative performance of each technique, black pixel and white pixel ratio has been calculated.
